

IN THE SPECIFICATION

Please amend the paragraph at page 4, line 28 to page 5, line 8, as follows:

At the first stage the prepreg plane sheet being the preliminarily impregnated with binder and preserved in such condition reinforcing fabric (glass fabric, carbon fabric, etc.) is placed onto the press heated slab plane surface and the blank is hot-pressed. At the same time the heat is supplied only along the parts 1, which have the shape of core ~~ridges~~ sides and whose area is less than that of the ~~ridges~~ sides, within the crash time sufficient to provide the degree of cure meeting the requirements of the following core shaping by means of bending. In the issue, obtained is the transformable structure consisting of relatively rigid elements (the ~~ridges~~ sides of the prospective core) and prepreg flexible parts in the zones between them.
